Rinzo Features: ... VNC-CMA-VC-BTT Plugin from FabFilter with an optional VNC Server, Media Accelerator or VC Server Description VNC-CMA-VC-BTT Plugin The VNC-CMA-VC-BTT Plugin lets you use up to 4 x VNC-CMA-VC-BTTs (with a maximum of 4 simultaneous connections per instance) to accelerate virtual local computer (VLC) media servers. VNC-CMA-VC-BTTs include a Media Accelerator or VC Server and a Virtual Computer running on that Media Accelerator or VC Server. The virtual computer (VNC-CMA-VC) is for recording and playback of audio and video. The Media Accelerator (VNC-CMA) processes the media files and decodes the audio and video formats into a common media format so that the virtual computer can render it on any type of platform that supports that format. This Plugin is currently only available for Windows systems. Requirements For a Media Accelerator (VNC-CMA): The Media Accelerator (VNC-CMA) and the VNC-CMA-VC-BTT Plugin are only compatible with a Windows OS and/or a Windows VNC Viewer. It is not compatible with Mac OS, Linux, or any UNIX operating systems. For a VNC Server (VC-BTT): VNC-CMA-VC-BTT Plugin is compatible with any type of VNC Server on a UNIX or LINUX OS, but we recommend to use a VNC Viewer for Windows with a VNC Server. 81e310abbf

Neon Gate VST is a programmable rhythm gate which will allow you to synchronize to the host BPM. The effect is often used in 'Trance' music. Supported platform: VST plugins can be used in any host which supports VST plugins, i.e. Windows, Mac OS, VST3, VST2 plugins and Linux. Details: - Native sample rates: 16 and 24 bit - Cross platform compatible (windows, mac, linux) - Uses low CPU - Supports host synced modulations and modulations of effects - Interval & step sequence based modulation modes - Unlimited arpeggiator modes & scales - Multiple effects section for complex modulation - Automation with granular control - Patch change display to change multiple parameters on a single synth - Click stops to trigger automation - Loops and groups - Pattern jog for rewinding pattern - Footswitch controls Features: Neon Gate is a programmable synths feature which allows to change any parameter(s) of the synth at the host level. Each parameter is shown in a sequence for step sequencing. This feature can be used to programmatically modulate any parameter at any time. This allows you to program the plugin to be a virtual drum machine that can be programmed with both real time modulation or a sequence. For example, you can set the plugin to be triggered by either a MIDI CC or a sequence of steps. This feature allows you to make any parameter or section of the plugin be modulated at the host level. This allows you to have both the host synchronize to the tempo of the synth's internal clock (where all internal parameters are synced with) as well as the synth being free to programmatically change parameters of the effect at any time (where each parameter is treated as a separate clock). [In addition to the list above, there are also several features that are not part of the core plugin, but that have been built into the plugin for the purpose of enhancing the plugin's ease of use, such as drag and drop patches, group auto naming and export to midi. Of course, the plugin can be used without these features. Many of the functionalities are

hidden until the user clicks on various menus that are in the plugins UI. For example, clicking on a menu item that says Export to MIDI will automatically trigger a pop up with a list of options which includes a drop down list from which to choose the name of the exported file. The plugin supports automation settings such as step, interval, touch and holding]. [BEWARE: Due to the nature of plugins, some functionality may not be completely compatible with every version of every platform (due to the fact that each platform has it's own set of limitations). Some plugins
