Apache Marmotta can be used to:

- Export the content of the cache for the Linked Media Framework
- Load and export Linked Data stored in the cache for third party developers.
- Create, edit and delete properties in the cache
- Import and export sets of properties.

The program's interface is controlled with a rich client, which allows to control a large number of applications and to start or stop them. On the basis of the Apache Marmotta, the backend supports:

- Apache Avro as a schema for Linked Data.
- Apache Calcite as a schema for caching.
- Apache Solr as a schema for indexing.
- Apache Neo4j as a schema for graph database.
- Oracle MySQL as a schema for any other types of databases.
- Apache Atlas as a schema for public Cloud.

The backend is based on the Linked Media Framework. It supports the execution of Linked Media Operations and allows you to easily export and import Linked Data. The main advantages of using Apache Marmotta are:

- It is a single server for managing several Apache technologies in a single installation.
- Apache Marmotta allows you to expose cache data as Linked Data to third party developers using the HTTP protocol.
- You can use the program as a standalone application or as a shared server.

Apache Marmotta has got a rich administration toolset that let you configure and customize a lot of options. It is mainly a tool that helps you create web applications. This tool lets you see the application start up. The Apache Marmotta Administration Console (AMC) is designed to allow you to manage a variety of Apache Marmotta configurations in an easy and efficient way. By using this tool, you can save time and enable you to perform critical activities from a web browser. Marmotta now has full support for XML Catalogs Marmotta is a Linked Data server. It is a REST and SOAP server, and it is based on HTTP. It uses the Tomcat server to run its web application. It implements a generic solution for REST and SOAP servers that allows you to use different service protocols and HTTP clients. Marmotta can work with Apache HttpClient, Apache Curl, any JAX-WS web service and also with GSON and Jackson. The Tomcat server uses a REST or SOAP connector to connect to your application. It supports REST and SOAP as well as two different ways of marshalling or unmarshalling. Marmotta has support for flat and hierarchical mappings. The server also supports the HTTP 1.1 protocol. Marmotta is an open source implementation of Linked Data (as the Media Hub specification is called). It follows the Linked Media Framework (LMF) specification. The LMF is a Linked Data protocol which ensures the Linked Data interoperability and access. Marmotta allows you to cache, transform, retrieve and publish Linked Data. Marmotta has been released in May 2008. It is built on top of the Linked Media Framework specification which is a technology that is linked to HTTP for getting data. Marmotta has been developed by a few companies such as Moven Technologies, IBM, Synology and VLSC. Marmotta is a REST and SOAP server and based on the Linked Media Framework specification. So, how can we find out information about this technology? First of all, we need to check the Web site of the project. Then, we can check the official site of the product, the documentation of the project, the wiki or forums. Open Source Linked Data Implementation Marmotta (named after the Latin word for the media memory) is a REST and SOAP server and an open
