KEYMACRO is a small cross-platform console application that makes sure the correct authorization method is used in a web application. Since the current version (v1.8.7) of the PHP web application framework Codeigniter does not correctly handle the Auth and Kohana frameworks, the developers of the product decided to create a small utility to make things a bit easier. On top of that, the developers decided to create a cross-platform application that would work regardless of the OS version and the fact that Windows users would have to download their copy. Applications that are installed via software center have a greater chance of being thoroughly tested but the developers understand the importance of users of other operating systems using the application as well, so in addition to the Windows version, there is also a Linux executable that is available for download. What is it? KEYMACRO is a small cross-platform application that is very easy to use. Since it is cross-platform, it has to be downloaded as a self-extracting executable, which means that all the files needed to execute the application are compressed in the downloaded package. The product works as a utility that checks whether the Authorization header is correctly being used when creating web sessions. It is important to note that at the moment the application only checks if the Authentication method is correct but the application can be extended to perform other actions such as checking the correctness of the login and session timeouts. Key MACRO handles all types of sessions that can be created using the Kohana framework and Auth is handled through either the standard PHP auth function or a custom made authentication extension. Key MACRO comes in very handy when the Auth system of a web application does not correctly handle the Authentication header. In fact, a lot of web frameworks do not correctly handle the Authentication header, so Key MACRO will be a handy tool for developers that use Kohana, Codeigniter, or some other framework that does not handle the Auth header correctly. How to install? Download the executable file from the website. Extract the files using WinRAR, extract the.exe file to any directory. Run the application by double clicking on the.exe file.
